المادة: The Elements of Art The

الموضوع: Value scale

الأسبوع: الرابع

Value is the degree of luminosity of color. It is ,for example the quality that differentiates dark red from a light red .In the diagram are 10 visually equidistant values or neutrals from black to white . The usual black therefore is value 1 and is notated as n1 .Perfect white is .practically unobtainable. Our most perfect white is Magnesium Oxide, which is 9.8 in value

The value of any color is determined by comparing it with the grays of the value scale, which will indicate how light or dark the particular color is. Colors are more contrasting when their values are widely separated or contrasting such as value 3 and value 8. Colors are more alike or harmonious when their values adjacent such as value 3 and value 4.
